

No Pneumonia - 29.7% - Moderate - leaning clear

1. Patient context

Patient ID: 00704310-78a8-4b38-8475-49f4573b2dbb**Study date:** 19010101**Modality:** CR**Age:** 75**Sex:** Male**Symptoms:** Dyspnea, Fever**Additional context:** Onset

2. Model result

Prediction: No Pneumonia**Pneumonia probability:** 29.67%**Inference time:** 105.37 ms**Model:** clinvision-v2 (threshold 0.5)**Request ID:** f283736d-1efe-4a30-b6f6-f6afa370f533

3. Visual evidence (Original vs Grad-CAM)

*Original radiograph**Grad-CAM attention overlay*

Warm regions influenced the model most. Grad-CAM is explanatory, not a validated lesion localizer.

4. Clinical summary (LLM)

Generated with free LLM (ollama:llama3.2)

1. Summary

The model estimated a pneumonia probability of 29.7% based on the provided image analysis. This output is for informational purposes only and should not be used for clinical decision-making. The clinical context provided is not integrated into the model's prediction.

2. Explanation

A probability of 29.7% indicates that the model is moderately uncertain about the presence of pneumonia. The Grad-CAM overlay highlights regions of the image that are most influential in the model's prediction. However, it's essential to note that this is not a validated lesion localization tool, and the Grad-CAM should not be relied upon for precise localization. The clinical context, including symptoms and patient demographics, cannot override the model's prediction, as it was not used in the analysis.

3. Indications and next steps

Consider the following possibilities: Clinical correlation with additional history and physical examination, repeat imaging to confirm or rule out pneumonia, specialist referral for further evaluation, or laboratory workup to assess inflammatory markers.

4. Limitations

The model output is probabilistic and requires professional review. The Grad-CAM overlay is not a validated lesion localization tool, and the clinical context is not allowed to override the image model prediction.

5. Limitations

- Model output is probabilistic and requires professional review.
- Grad-CAM highlights influential image regions; it is not a validated lesion localization tool.
- Clinical context is not allowed to override the image model prediction.
